**ABSTRACT OF THE DISCLOSURE**

A method for representing a motion for two blocks. The method generally includes the steps of (A) exchanging a particular value of a plurality of values with a memory, each of the values defining which of the two blocks use which of a plurality of motion  
5 vectors based upon one of a plurality of prediction types and (B) representing the motion for the two blocks with a group comprising the particular value and up to all of the motion vectors.
